File Copy Studio

Update Manual · Version 2026.09.08.0002

Recent release notes. See CHANGELOG.md in the install folder for full history.

[2026.09.08.0002] -- 2026-09-08

Executed against `FileCopy_Full_Review_2026-09-07.md`'s Phase 1-4 plan; confirmed by Matthew's local build (`_build-status.txt`: BUILD OK).

Fixed

- **Cross-thread `FileItem` property-changed notifications from copy-worker threads.** `FileItem` mutated `INotifyPropertyChanged` properties directly from background copy-worker threads while the DataGrid bound to them on the UI thread -- a plausible cross-thread crash, worse with `MaxParallel > 1`. Fixed at the `FileItem.Notify()` level: added `FileItem.UiDispatcher`, and `Notify()` now marshals the event raise via `Dispatcher.BeginInvoke` when called off-thread (the field write itself stays synchronous, so same-thread reads right after a set are unaffected). `RunAsync`/`VerifyOnlyAsync` gained a `uiDispatcher` parameter stamped onto every item at entry, threaded through `ICopyEngine`/`DefaultCopyEngine`/`CopyOrchestrator`.
- **Symlinked *file* sources (not just directories) could escape the source root under the default `Follow` policy.** Added a `PathIsInside(target, sourceRoot)` check in `Enumerate()`'s file loop, mirroring the existing directory-junction guard. Scoped to `Follow` only -- `Preserve` doesn't read target bytes, so it isn't a content-exfiltration risk.
- **A scheduled job that threw before its normal completion path (e.g. a dropped network share) failed silently**, with no tray notification. Added an Error-icon balloon + `SystemSounds.Hand` to that `catch` path, matching the notification the success path already sends.
- `docs/README.md`**'s version string was stale** (`2026.05.09.0001`), not wired to the auto-bumped `version.txt`/csproj/installer -- corrected, still a manual step each release.

Changed

- **Per-row `ProgressBytes` writes** moved into the existing 50ms UI-update throttle gate in `Report()` -- was firing unconditionally on every chunk callback (thousands of times/sec on fast drives).
- **Picker filter row** (size/count fields, date pickers, Clear/Select All/None/Invert): all controls grown from 32-36px to the app's 44px WCAG AAA touch-target floor.
- Added `DatePicker`/`Calendar` implicit theme styles to `App.xaml` (background/foreground/border/font/min-height only -- the `Calendar` popup's individual day-cell numerals still render via OS `SystemColors`, flagged as a known remaining gap rather than claimed fixed).
- `AboutDialog`/`HotkeysDialog` resize grips replaced with the same accessible Canvas+Polygon pattern (focusable, keyboard-resizable) already used in `MainWindow` -- `PresetSlotDialog` still uses the older WM_SYSCOMMAND-only drag grip and is a follow-up candidate.

Corrected from prior review

- Bandwidth throttle UI, the transfer history/log viewer, and per-job scheduled-run notifications were all already implemented before this cycle -- the source review's "Feature Gap" list was stale/incomplete on these three items.

Builds prior to 2026-09-08 were not individually changelogged. See `Suite_Review_2026-08-28.md` and `todo.md` for the pre-2026-09 history.
