NoteStation

Update Manual · Version 2026.09.09.0003

Recent release notes. See CHANGELOG.md in the install folder for full history.

[2026.09.09.0003] -- 2026-09-08/09

Fixes from `NoteStation_Full_Review_2026-09-07.md`'s Critical/High findings. Source-level changes only in the session that made them (no `dotnet` toolchain available) -- pending a local build confirmation.

Fixed

- **CRITICAL:** `BrushSurface`**/**`BrushSubtle` **resource keys, used 22× in** `MainWindow.xaml` **(Calendar view, Focus Mode button, day-of-week headers), were undefined in all 130+ theme files.** An unresolved `DynamicResource` doesn't throw in WPF -- it silently left `Foreground` at its default (effectively black) and `Background` transparent, making the Calendar view and Focus Mode button unreadable on every dark theme. All 22 call sites now reference the real 13-brush contract (`BrushSurf2`/`BrushHint`/`BrushMuted`) instead of the two nonexistent keys.
- **The "atomic" write helper wasn't atomic.** `Settings/DataStore.cs`, `Settings/AppPrefs.cs`, and `MainWindow.xaml.cs`'s `PushTaskToTimerStudio` all did `File.WriteAllText(tmp) -> File.Copy(tmp, path, overwrite) -> File.Delete(tmp)` -- a full byte-for-byte copy has its own crash/power-loss window the pattern was meant to eliminate. All three sites now use a single `File.Move(tmp, path, overwrite: true)`. Worst-case exposure was TimerStudio's own `timers.json`, written cross-process with no lock.
- `FilterChip`**'s hardcoded colors (**`#A6ADC8` **foreground) failed contrast on light themes** -- measured ~2.2:1 against `Light.xaml`'s background, well under the app's 7:1 AAA bar (and even AA's 4.5:1). Split into two styles: `OverlayFilterChip` keeps the hardcoded colors for the two fixed-dark overlay windows (which paint their own chrome regardless of app theme), and `FilterChip` now routes through `DynamicResource BrushMuted`/`BrushSurf2` for `MainWindow`, so it stays AAA-contrast on all ~20+ light themes too.

Known open items (not addressed this cycle)

- `MainWindow.xaml.cs` remains a 5,387-line God Object with no MVVM extraction -- the suite's largest maintainability risk, carried forward since the 2026-08-28 suite review.
- Category chips are still built in code-behind (`RefreshCategoryChips`), bypassing the app's focus-ring style and missing `AutomationProperties.Name`.
- `SaveTasksAsync` has no ordering guarantee between overlapping background writes on rapid successive drag-reorders.
- Note-lock PIN is still unsalted single-round SHA-256 (UI-only obfuscation, not encryption).
- No implicit `ContextMenu`/`MenuItem` style -- falls back to OS chrome (shared gap across the suite).

[2026.09.04.0004] -- 2026-09-04 -- Editorial theme redesign

Implemented following a mockup canvas review Matthew approved. Not build-verified at the time (fixed above, 2026-09-08/09).

Added

- **Editorial theme** (`Themes/Editorial.xaml`) -- navy/blue dark theme, same 13-brush contract as every other theme, contrast hand-verified 7:1 AAA except `BrushHint` (~5.2-6.7:1 AA, documented -- scoped to timestamps/placeholder text only). Not set as default; selectable via the Theme menu.
- **Typography**: `AppFontFamily` now leads with Inter, `DisplayFontFamily` leads with Instrument Serif (both fall back to Segoe UI/Georgia if not installed). Wordmark, sidebar section labels, and all 9 Settings section headers render in the serif/italic display font.
- **Vector icon system**: ~20 new `PathGeometry` resources replacing emoji glyphs across the title bar, NavRow, toolbars, sticky-note buttons, and Settings dialog.

Fixed

- `BtnClipSort`/`BtnNoteSort`/`BtnTaskSort` click handlers were overwriting the new icon+label button content on first click -- each button's label `TextBlock` now has its own name and the handler updates just the text.
