Reticle Overlay

Update Manual · Version 2026.09.08.0001

Recent release notes. See CHANGELOG.md in the install folder for full history.

[2026.09.08.0001] - 2026-09-08

Added

- Real per-game auto-switch: each profile now has an optional "Auto-switch .exe" field (Profiles panel); when enabled in Settings, the foreground process is polled every 2s and the matching profile is applied automatically. Closes the gap between the advertised (but previously nonexistent) auto-switching feature and PRIVACY.md/the installer's description of it.
- Overlay now recovers from live display changes: monitor unplug/replug, resolution change, or DPI change while running triggers an automatic re-position/re-clamp instead of leaving the reticle stale until the monitor dropdown is touched by hand.
- ~1 Hz `HWND_TOPMOST` re-assertion timer on the overlay window, so the reticle recovers after exclusive-fullscreen games steal the topmost z-order.
- Basic app-wide unhandled-exception logging (`DispatcherUnhandledException`, `AppDomain.UnhandledException`, `TaskScheduler.UnobservedTaskException`) with a best-effort prefs flush before the process exits; does not suppress the crash, only makes it diagnosable.

Changed

- Re-derived `BrushMuted` (and `BrushText` in the 10 themes where it was also flagged) across all affected theme files to 7:1 WCAG AAA against both `BrushBg` and `BrushSurf`, including the four themes that previously failed even AA (`C64`, `Palenight`, `Abyss`, `TerminalRed`).
- Added the missing implicit `ContextMenu`/`MenuItem`/`Separator` style to `App.xaml` so the theme picker and preset-save context menus follow the active theme instead of rendering OS-default chrome.
- `InputDialog` now uses `ResizeMode="CanResizeWithGrip"`, matching every other dialog in the suite.
- Custom PNG reticle images are now decoded at a capped `DecodePixelWidth` (512px) instead of full native resolution.
- `AppPrefs.Save()` now does a true atomic `File.Move` instead of copy-then-delete.

Fixed

- Preset-slot button tag parsing now uses `int.TryParse` instead of an unguarded `int.Parse`.
- The extracted tray icon handle is now explicitly disposed, closing a one-time handle leak.

Removed

- Dead `App.xaml.cs` `DisplayName()` theme-name switch (never called; the theme picker's own name table was already the single source of truth).

[2026.09.01.001] - 2026-09-01

Fixed

- Uninstaller autorun cleanup deleted the wrong registry value name (`"Reticle Overlay"` vs. the app's actual `AppKey` of `"ReticleOverlay"`), so the Run entry silently survived every uninstall. Added `APP_RUN_VALUE` matching `AppKey`.

- Profile Import previously did a full `File.Copy` replace despite the dialog saying it would "merge" -- silently dropped every existing profile not present in the imported file. Implemented a real by-name merge (existing untouched, same-name overwritten, new-named appended) with an accurate "N added, M updated" completion message.
- `build.bat`'s build-number parser assumed a fixed 3-digit segment and mis-computed the next build number once `version.txt` held 4 digits (would have jumped from build 2 to 9003 on the next same-day rebuild). Replaced the parse and the zero-pad with digit-width-agnostic PowerShell one-liners.
- Fixed a doubled resize-grip visual on `MainWindow.xaml` (both a native `CanResizeWithGrip` chrome grip and a hand-drawn keyboard-accessible corner glyph) -- switched to `ResizeMode="CanResize"`, kept the functional custom glyph.

Changed

- Ported the suite's `VersionInfo` helper into `Core/VersionInfo.cs` and rewired `AboutDialog.Version` to it, replacing an ad-hoc `FileVersionInfo`/`Assembly.GetName().Version` lookup.
- Removed `signtool` invocation from `build.bat` (no code-signing certificate exists or is planned for this app); builds are unsigned by design.
