Timer Studio

Update Manual · Version 2026.09.08.0001

Recent release notes. See CHANGELOG.md in the install folder for full history.

2026.09.08.0001

Fixed

- `version_bump.ps1` **parse error on the version-sync code added in** `2026.09.01.0001`**.** The first `build.bat` run after that release failed at the version-bump step with a PowerShell parse error around an em-dash (`--`, U+2014) inside the new README-patching code. Root cause: the script (like other files in this suite) is saved as BOM-less UTF-8, and Windows PowerShell 5.1 reads a BOM-less `.ps1` using the system ANSI codepage, not UTF-8 -- a literal em-dash inside a comment survives that mis-decoding fine, but the same character inside an actual string/regex token corrupts the token stream. Fixed by building the dash at runtime (`$dash = [char]0x2014`) and concatenating instead of embedding it as a raw character in code.
- Confirmed the `version.txt`/README/csproj/installer sync check added in `2026.09.01.0001` now runs clean on a full `build.bat` pass.

2026.09.01.0001

Bug Fixes -- Critical

- `TimerStudio.csproj` **1.6 GB mojibake corruption** -- the project file is a clean, ~40-line file again.
- **NoteStation push schema mismatch** (`Core/JsonSerialization.cs`): `TimerStudioJsonContext` now sets `PropertyNameCaseInsensitive = true`, so timers pushed in by NoteStation deserialize correctly instead of silently failing to bind.

Bug Fixes -- High

- `timers.json` **blind-overwrite** (`Core/TimerPersistence.cs`): added `LastKnownWriteUtc` / `ExternalChangeDetected()`. `MainWindow.SaveTimers()` now calls a new `MergeExternalTimerChanges()` before every autosave, additively picking up any timer NoteStation pushed since the last save without discarding existing cards -- closes the receiving side of the NoteStation "TimerStudio push" integration.
- `ListView` **selection-highlight contrast** (`CalendarEventPickerDialog.xaml`, `CategoryManagerDialog.xaml`): both now carry a themed `ItemContainerStyle`/`ControlTemplate` that paints selection/hover from `BrushSurf2`/`BrushHint` instead of OS `SystemColors.Highlight*`.

UI / Accessibility

- **Shared** `Slider` **style** (`App.xaml`): implicit `TargetType="Slider"` style (44px `MinHeight`, themed track/thumb, focus ring) now applies across all ~21 slider instances in the app.
- **Resize-grip keyboard alternative** (WCAG 2.5.7): `MainWindow.xaml.cs` gained `ResizeHandle_KeyDown` -- arrow-key resize, Shift for 1px fine-tune.
- **Suite-wide version display** (`Core/VersionInfo.cs`): ported in from BadgeOverlay, giving a consistent `"v2026.09.01.0001"`-style display in the About dialog.
